

Battery Saving Tips: Lua on iOS

1. iOS 8 gives a percentage breakdown of the apps that are draining the most battery. To identify which apps you should close when not in use, visit [Settings > General > Usage > Battery Usage](#). You can then close out of these apps if you are not using them or just delete them.
2. One of the biggest offenders of battery life for iOS is the “Parallax” feature. To turn it off, visit [Settings > General > Accessibility](#) and switch Reduce Motion to "on."
3. Some apps are defaulted to refresh automatically. Visit [Settings > General > Background App Refresh](#) to change these settings on each app.
4. This may seem obvious, but your display shining brighter than necessary can drain your battery. Use the Control Center or visit [Settings > Wallpapers & Brightness](#) and disable Auto-Brightness and decrease the setting manually.
5. Turn off Bluetooth
6. Turn off Location services. You can disable this by going to [Settings > Privacy > Location Services](#) and pick the apps you don't need it for.
7. Set Auto lock to shorter time period. Go to [Settings > Passcode](#) to adjust this.
